

## QuickData™

### BENEFITS

- Eliminates the manual data entry process
- Eliminates incorrect data being input into agency databases
- Report/form data is immediately available in records and court systems
- Eliminates duplicate data entry of report/form information
- Works with any back-end software - no need to replace existing technology

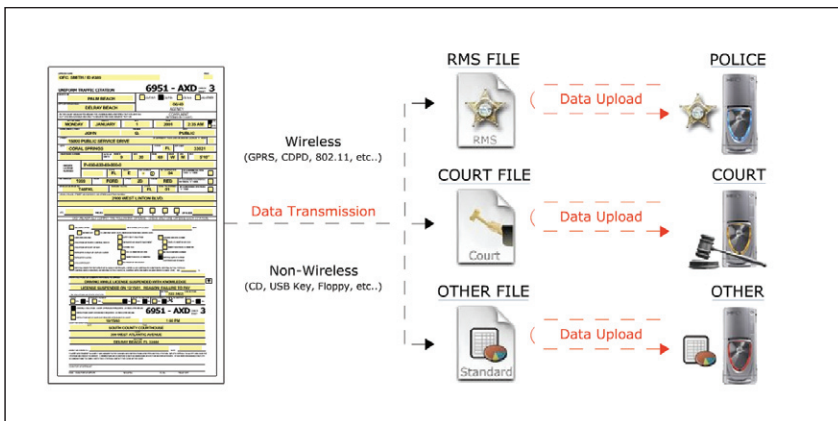

### Electronic Transmission of Field Data to Back-end Database Systems

QuickData™ is the APS application that enables agencies to electronically transfer the information/data from the electronic version of an agency's form/report to any back-end database system (including Records Management Systems (RMS) and Court Case Management Systems).

An officer completes the requisite agency form/report on a mobile computer or handheld device utilizing one of the APS electronic forms applications (QuickTicket™, QuickCrash™, PocketCitation™, etc.). Once the form is printed and saved, a data-file is created with the requisite information that needs to be entered into the back-end database system (or multiple files are created if the data needs to be transferred to multiple databases). This file is electronically transmitted to the appropriate RMS and/or Court system utilizing the established network connection. The administrator of the designated RMS and/or Court system will upload the data using a number of different protocols.

QuickData eliminates the need for data entry clerks to transcribe data from hand-written reports and forms, such as: traffic citations, parking tickets, accident reports, racial profiling data, inspection forms, inventory supply, barcode data, forecasting and more. QuickData is a 100% accurate and reliable method of getting data from field reports and forms into the necessary back-end database systems. Hence, there is never a "backlog" of information to be manually entered, and the data is available sooner for reporting and analysis.

Advanced Public Safety (APS) develops innovative technology solutions specifically designed to address the challenges of today's public safety agencies. APS focuses on creating solutions that operate in conjunction with the mobile computers and handheld devices utilized by law enforcement, corrections, fire and EMS personnel. The APS solutions work with an agency's existing technology infrastructure to significantly increase officer safety and productivity.

QuickData™ transfers data from any electronic form to any back-end database system (RMS, Court, etc.).
